AIR QUALITY CRITERIA FOR PARTICULATE MATTER (EXTERNAL REVIEW DRAFTS, Oct 1999 to Aug 2004)

With regard to causal inferences described in the Integrated Science Assessment, the Policy Assessment notes that since the last review, the Agency has developed a more formal framework for reaching causal determinations that draws upon the assessment and integration of evidence from across epidemiological, controlled human exposure, and toxicological studies, and the related uncertainties, that ultimately influence our understanding of the evidence U.

Particulate Matter (PM) Air Quality Standards

The final version of the entire PM Criteria Document was issued in October 2004. Supporting these results are new longitudinal cohort studies conducted by other researchers in varying locations using different methods U. EPA, 2011a which

Filesize: 51.42 MB

provides as broad an array of policy options as is supportable by the available information, recognizing that the selection of a specific approach to reaching final decisions on the primary PM_{2.5}.

Air Quality Criteria for Particulate Matter (Final Report, 2004)

This included using the single rollback approach used in the risk assessment conducted for the last review which reflects a uniform regional pattern of reductions in ambient PM_{2.5}. The EPA proposes changes to the Air Quality Index AQI for PM_{2.5}.

Particulate Matter (PM) Air Quality Standards

The EPA also proposes an approach for implementing the PSD program specifically for the proposed secondary standard. Notably absent from the final rule, moreover, is any indication of how the standard will adequately reduce risk to the elderly or to those with certain heart or lung diseases despite the EPA's determination in its proposed rule that those subpopulations are at greater risk from exposure to fine particles and the evidence in the record supporting that determination.

Air Pollution from Particulate Matter

Current PM NAAQS Review C.

Air Pollution from Particulate Matter

The extended follow-up to the ACS study reported an association between long-term PM_{2.5}.

AIR QUALITY CRITERIA FOR PARTICULATE MATTER (EXTERNAL REVIEW DRAFTS, Oct 1999 to Aug 2004)

The highest levels of particulate matter is generally near roadways, so you should avoid exercising in those areas. Closure was reached on Chapters 7 and 8. With regard to the Harvard Six Cities Study, the original and reanalysis reported positive and statistically significant effects associated with a long-term mean PM_{2.5}.
