In addition, an estimate of the API gravity of the oil-in-place is possible. After the Middle-Late Triassic Eo-Cimmerian tectonic phase resulting from the collision of the Cimmerian blocks with Eurasia, an extensional event developed during the deposition of the Shemshak Formation Late Triassic to Middle Jurassic. He organized the Congress of the International Association of Sedimentologists, held at McMaster in 1982, and attended by 1200 registrants from 42 countries.

GEO 2004 Conference Abstracts

The location of the kink was found to be in agreement with the location of the inferred fault. The results of TOC measurements range between 0.

Primary Sedimentary Structures and Their Hydrodynamic Interpretation

Moreover, the nature of the major porosity system, such as pore-throat and the lateral extension of these streaks were found to greatly impact their dynamic behavior.

Alternative marine and fluvial models for the non

Diagenesis cementation and compaction is interpreted to play a major role in reservoir quality distribution within the established high-frequency sequence stratigraphic framework. This is corroborated by shallow water deposits located at midoceanic points as much as 10,000 feet below present sea level.

Primary Sedimentary Structures Formed by Turbidity Currents and Related Resedimentation Mechanisms

This study is part of the Middle East Basins Evolution Programme MEBE.
