Now try a few examples and see if our the pattern holds. If a is the first term of a finite AP and d is a common difference, then AP is written as — $a, a+d, a+2d, \dots, a+(n-1)d$. Old Gauss Now, how on earth did he do it? He came up with the answer to the above problem in a matter of seconds.

Abstract: This text begins with a discussion of general lemmas and advances to an investigation of Waring's problem, including explorations of singular series, the contribution of the basic intervals, and an estimate for $G(n)$. Our final solution for the beginning of a proof is then: Proof: Suppose G is a particular but arbitrarily chosen complete, bipartite graph. The Distribution of the Fractional Parts of the Values of a Polynomial.
