## Manage Forests and Land

Well over 300 establishment foresters, tree crop supervisors and planners, establishment and silvicultural foresters, resource managers, remote sensing, GIS and mapping specialists and inventory foresters were involved in Rotorua on 18-19 November 2020. Canadian Journal of Forest Research 42:238-246. To inquire about our seedlings, call us directly using the numbers below.

## Our Seedlings

Selecting stocktypes for mesic site conditions may only be limited by the minimum growth gains desired. The Southern Forest Tree Improvement Committee SFTIC is the professional organization of tree improvement specialists throughout the southeastern United States. In order to ensure the best selection of seed sources and genetics, order your seedlings in January through May of the year before you intend to plant.

## Nursery Stock Availability for 2021

We Will: Advise you about your land as if it were our own. It can fire out two seeds per second at velocities of anywhere between 150 and 300 metres per second into the soil. In the 8 years since the North American Containerized Forest Tree Seedling Symposium in August 1974, southern foresters have developed container seedling nurseries and begun large-scale planting programs.

## Container Tree Manual

Probably more than any other cultural practice, fertilization and irrigation control both the rate and type of growth in container seedlings. Our forest genetics program continues to pioneer new techniques in breeding and testing, developing advanced technologies to not only improve the growth and straightness of your future sawlogs, but the wood quality as well.

## Manage Forests and Land

Be there when you harvest in 25 years! Rayonier Seedling Division Contact: Elberta Nursery Address: 29650 Comstock Road Elberta, AL 36530  
Phone: 251-986-5210 Email: seedlings@rayonier.com Planting containerized seedlings is not a substitute for good quality site preparation or genetic improvement. This marked improvement over bareroot is due to the fact that container seedlings take 100 percent of the root system to the field providing better root establishment and less transplant shock.
