## Digging through 230 million

*Longostachys latisorophyllus* and *Mixostrobus givetensis* are two heterosporous lycopsids from the Givetian of China and Kazakhstan, respectively, that show close affinities to arborescent lycopsids, possibly representing ancestral groups to the subsequent bisporangiate-strobilus clade. This group involves most of the studied species and their parent plants. .

## Palaeoecological constraints of some *Lepidostrobus* cones and their parent plants from the Late Palaeozoic continental basins of the Czech Republic

The pedicel is wedge-shaped in abaxial view, with a distinctive median ridge or keel k in , representing the possible position of a vascular bundle. Figures were computerized using CorelDraw 10. *Lepidostrobus* is rediagnosed as a genus of microsporangiate cones.
