Planet Viewing

To give you an idea of just how radiant Venus is, it's now 21 times brighter than , the brightest of all stars. TMN Editor Nicole Pasulka believes she could beat a lie detector.

Also, waiting for and capturing good light is the hardest part—patience is virtue in this game and being prepared is essential. Venus' trip through the triangular face of Taurus, the Bull will be concluding on Sunday, July 12 when the bright planet passes less than a finger's width to the upper left or 57 arc-minutes to the celestial north of Taurus' brightest star, Aldebaran. Independence Rock, in Natrona County, Wyo.
