**Deuterium Distribution in the Gulf of Mexico in: Journal of Physical Oceanography Volume 3 Issue 2 (1973)**

Dashed or dotted lines on the ADCPs indicate their nominal profiling range which for the 300-kHz ADCP is 100 m and for the 75-kHz ADCP is 500 m. Deep-C was a four-year, interdisciplinary study of deep sea to coast connectivity in the northeastern Gulf of Mexico.

**Robert Hetland**

Values are normalized for the average annual value from 1978 to 1995. Certainly the less explained variance of the total transport in Florida has to do with the strong baroclinic tidal structure observed in this section, where the phase of the main diurnal tidal constituents of the along-channel currents tend to be 180° out of phase between being above or below 800-m depth. West Florida shelf circulation on synoptic, seasonal, and inter-annual time

scales, in Circulation in the Gulf of Mexico, W.

### **Current meter data from moored current meter in the Gulf of Mexico as part of the Gulf of Mexico Physical Oceanography project from 1984**

These authors suggested that significant compensation through other channels off the GoM was required to match the 32-Sv mean transport from cable measurements of the Florida Current at 27°N, as also suggested in the work of. With its focus on society and environment, Geography is one of the most popular subjects in formal education and highly relevant to both life-long learning and fulfillment from travel.

### **Gulf of Mexico Gas Hydrates Joint Industry Project (JIP) Characterizing Natural Gas Hydrates in the Deep Water Gulf of Mexico**

Fitting exponential functions one obtains 536 m, 51 km for the vertical, horizontal scales in Yucatan, while in Florida one obtains 490 m, 26 km; these calculations are included in the online supplemental material. The procedure is as follows: a set of horizontal and vertical scales is chosen for objectively interpolating the hourly current maps in the channel section. Picture a lump of rock about the size of a potato.

### **The Flow through the Gulf of Mexico in: Journal of Physical Oceanography Volume 49 Issue 6 (2019)**

This geographic area contains naturally rich soils of the prairies, as well as agriculture. These resolutions provide a section with 2101 regular cells in Yucatan and 1081 in the Florida sections. The 20-day low-pass-filtered transport series have a correlation of 0.

### **Physical oceanographic conditions in the deepwater Gulf of Mexico in summer 2000**

At the surface and within the water column, the topographic steering of the canyon will control the dominant direction of transport and guide oil onshore.
