$$\pm 4 = \frac{1}{2} [k(0-2) - 0(4-0) + 1(8-0)]$$

$$\pm 4 \times 2 = (k(-2) - 0 + 1(8))$$

$$\pm 8 = -2k + 8$$

Therefore, we get:

$$8 = -2k + 8 \text{ (or)}$$

$$-8 = -2k + 8$$

Now, solve both the equations, we get:

Solving $8 = -2k + 8$

$$8 - 8 = -2k$$

$$0 = -2k$$

$$k = \frac{0}{-2} = 0$$

A short survey of some recent applications of determinants

AVAILABLE Last checked: 24 Minutes ago! In contrast, the shelves of every mathematics library groan under the weight of books on linear algebra, some of which contain short chapters on determinants but usually only on those aspects of the subject which are applicable to the chapters on matrices. Its origin is distinct from that of the Toda equations, but it is of a similar nature and clearly belongs to this section. The Bibliography contains references not only to all the authors mentioned in the text but also to many other contributors to the theory of determinants and related subjects.

We are indebted to our colleague, Dr. Both this book by Vein and Dale and the Clifford algebra books and papers use algebra in physics largely

to replace hard to manipulate geometry and unwieldy matrices. The number i thus corresponded to the segment of length 1 that was perpendicular to the x -axis.
