

Hamilton harbour trace contaminants - 1982-83 - loadings to, and concentrations in the harbour

Ontario Ministry of the Environment - Evaluating inputs of heavy metal contaminants and phosphorus to lake ontario from Hamilton Harbour

Description: -

-
Recreational surveys -- Finland.
Ski lifts -- Finland -- Statistics.
MacNachtan, -- Clan.
Hamilton Harbour (Hamilton, Ont.).
Harbors -- Ontario -- Hamilton.
Water -- Pollution -- Ontario -- Hamilton.
Trace elements in water -- Ontario, Lake (N.Y. and Ont.)
Water -- Pollution -- Ontario, Lake (N.Y. and Ont.)Hamilton
harbour trace contaminants - 1982-83 - loadings to, and
concentrations in the harbour
-Hamilton harbour trace contaminants - 1982-83 - loadings to, and
concentrations in the harbour
Notes: Bibliography: p. 31-33.

Impact of River Transport Characteristics on Contaminant Sampling Error and Design

Sources apportionment and carcinogenic risk of polycyclic aromatic hydrocarbons in gas phase of urban Shanghai: Based on high volume solid phase extraction Hi-volume SPE. Remedial measures considered for Hamilton Harbour include point source and non-point source control.

Identifying and evaluating urban mercury emission sources through passive sampler

Orange bounded area of inset delineates the 'downtown core'—bounded north-south: Bloor St to Lake Ontario, and east-west: Bathurst St to Don River. For permission to reproduce, republish and redistribute this material, requesters must process their own requests via the RightsLink permission system. We attempted to align source transects closely with predominant wind directions.

Source Apportionment of PAH in Hamilton Harbour Suspended Sediments: Comparison of Two Factor Analysis Methods

The latter may include an open-ended question, a bidding situation with the starting points suggested by the interviewer, or choice by the respondent of one of a selection of values suggested by the interviewer. Chemosphere 2006, 63 1 , 116-131. Macerollo, C, and Ingram, M.

Source Apportionment of PAH in Hamilton Harbour Suspended Sediments: Comparison of Two Factor Analysis Methods

The analysis is based on variations of three key factors: estimates of non-use values, use estimates for fishing and swimming and the time horizon for converting capital costs into annual values. Critical Reviews in Environmental Science and Technology 2012, 42 11 , 1172-1189.

Impact of River Transport Characteristics on Contaminant Sampling Error and Design

In the case ofMWW, toxicity is usually attributed to ammonia, total residual chlorine in the case of chlorinated effluents , cyanide, sulfides, phenols, surfactants and several heavy metals including copper, zinc, chromium and nickel. Nonetheless, this was not always possible due to the

presence of Lake Ontario, major highways, private property, or irregular winds during the sampling periods.

Distinguishing the Contributions of Residential Wood Combustion and Mobile Source Emissions Using Relative Concentrations of Dimethylphenanthrene Isomers

Data was collected from existing sources where they existed, but primarily through interviews with user groups. A similar pathway model was initiated for toxic substances but not completed at the conclusion of this study. Thesis, Modelling Sediment Oxygen Demand in Lakes, McMaster University.

Distinguishing the Contributions of Residential Wood Combustion and Mobile Source Emissions Using Relative Concentrations of Dimethylphenanthrene Isomers

Cite this article Mayer, T.

The effect of divalent metals and laminar shear on the formation of large freshwater aggregates, Hydrobiologia

As noted, these results are highly dependent on estimates of non-use value, which should be regarded as preliminary. The maximum capacity can be calculated for the Harbour's facilities using a method in the Ontario Recreation Supply Inventory ORSI. Measure 7 represents the cumulative effect of point source control to and including Option 9.
