## 20.2 Biogeochemical Cycles

What is the Nitrogen Cycle? Environmental Protection Agency EPA , nutrient pollution caused by in the air and water, is one of the most widespread, costly and challenging environmental problems. Four in every 100 meat processing workers suffered a recordable workplace injury in 2019, according to the most recent federal statistics. The Phosphorus Cycle Phosphorus is an essential nutrient for living processes; it is a major component of nucleic acids and phospholipids, and, as calcium phosphate, makes up the supportive components of our bones.

### Workers escaped deadly leak by going through nitrogen fog

A Venus flytrap has specialized leaves to trap insects. These soil microorganisms pull nitrogen from the soil when the residues of decomposing plants do not contain enough nitrogen. Trees naturally absorb CO<sub>2</sub> while they are alive.

### Nitrogen

All of these cycles fall under the name nutrient cycle. The sediments, as defined in this diagram, do not include the ~70 million GtC of carbonate rock and kerogen.

### Workers escaped deadly leak by going through nitrogen fog

The plant is a total parasite a holoparasite because it is completely dependent on its host. Without any Nitrosomonas colonies established to consume this toxin, levels climb and spike until the ammonia-loving bacteria population catches up.
