ethnicity, religiosity, age, gender and socioeconomic status were used as the criterion variables. Within-study meta-analysis of all the results found that extreme liberals had a 150% increased rate of mental illness compared to moderates.

## Leftism and Mental Illness: New Statistical Evidence

Ss expressed such emotional responses as shock, guilt, depression, and loneliness both at the time of death and at the time of the interview. Research was conducted using questionnaires that were returned by mail. Research also shows that people also use religious coping to deal with everyday stressors in addition to life-changing traumas.

## The role of religion and spirituality in mental health

Following the growing call for religious research and practice by prestigious research associations of mental health, 25 religious coping should be regarded as an advantageous tool in recovery that is free, accessible, and effective.

## Religiosity, Atheism, and Health: The Atheist Advantage

The Family Adaptation Cohesion and Evaluation Scale FACES-III , Diagnostic Interview Schedule DIS and the Center for Epidemiological Study of Depression CES-D Scale and the Diagnostic Interview Schedule for Children DISC were employed. Few differences were found for alcohol use, religion, or careers. Five schools were randomly selected for inclusion in the study.
