These calculations are summarized in this report and include criticality, burn-up, neutronics parameters, steady-state thermal hydraulics, and postulated transients. These signatures, reflecting gross gamma intensity and the 242,244Cm content, contain information on the burn-up BU and cooling time CT of the fuel.

Risk Management and an Approach to Validation

Максимальная оцененная относительная погрешность расчета коэффициента размножения в холодном состоянии для систем с плутониевым и MOX топливом равна $\pm 0,5\%$. GCRs are extremely high-energy events that originate outside the Solar System
