Water vapour, dust particles, ozone, and other trace gases are also present in a small percentage.

INFLUENCE OF SOLAR AND GEOMAGNETIC ACTIVITIES ON CLIMATE

Sunspots have been framed for communicable CDs and non-communicable disorders NCDs , same as epidemics ; ; ; Chronic NCDs account for over 70% of early deaths worldwide, while stroke is the second leading cause of death and disability; the latter is associated with high expenses in health services, and constitutes a public health challenge. They can have significant effects on weather and climate.

SunSpot Activity & Its Remarkable Predictive Effect

As a result, the majority of trends in the residual Sq amplitude that passed through a trend test showed negative values over a wide region. Figure 5 after Peixoto and Oort 1992 shows Northern Hemisphere temperature anomalies for the troposphere and the low stratosphere.

SOLAR FORCING OF EL NIÑO AND LA NIÑA

Solar cycle also affects the of objects by affecting the density at the upper levels. The location of these observatories is shown in. The data for all the three elements — declination D and horizontal and vertical intensities H and Z — are analysed, by dividing the data suitably for a study of the seasonal variations, the effect of the changes in the solar and magnetic activities on S and L, the oceanic dynamo contribution to L, and their interactions with each other.
