### Mammals: Mammalia

From my results, I discuss how current barrage-canal operations could influence dolphin stranding risk, and their implications for flow management in the Ghaghara—Sharada river basin. In recent studies, the form inhabiting the Caucasus region was allocated to the species *Myotis tschuliensis*.

### Mammalia Meaning

In both cases reproduction occurs as a single investment of energy in offspring, with no future chance for investment in reproduction.

### ADW: Mammalia: CLASSIFICATION

Mammalian young are often born in an altricial state, needing extensive care and protection for a period after birth. This bone is called the dentary because it holds the teeth of the lower jaw. When resources are abundant, the mother may be able to care for young on her own and males will attempt to sire offspring with multiple females.

### Mammals: Mammalia

Reproduction Generally, most mammalian species are either polygynous one male mates with multiple females or promiscuous both males and females have multiple mates in a given reproductive season.

### ADW: Mammalia: CLASSIFICATION

What this means is that mammals can breathe and utilize oxygen more efficiently than other vertebrate orders, which, combined with their warm-blooded metabolisms allows for a wider range of activity and the fuller exploitation of available ecosystems. The strategy for these species is to invest energy and resources in a few, highly developed offspring that will grow to be good competitors. Systematists do not yet agree on the exact number or on how some orders and families are related to others.

### Class Mammalia

Whether it is conspecific with *Crocidura portali* described in 1920 from Israel and usually synonymized with *C. marsupialis*. Marsupials give birth to highly altricial young after a very short gestation period 8 to 43 days. Taxonomy is based on the IUCN Red List, but differs slightly for a few species.
