Explain Ans: The antiparallel, double-stranded nature of the DNA molecule led Watson and Crick to hypothesise semi-conservative mode of DNA replication. They suggested that the two strands of DNA molecule uncoil and separate, and each strand serves as a template for the synthesis of a new complementary strand alongside it. It might be the possibility of arrival of variations inside the genes after the point of divergence of the species.

Answer: Molecular Biology Problems

Ans: The regulatory genes that produce a regulator protein controls induction i. The branching pattern of tree is calculated using the principle of parsimony based on economy to determine the minimum number of genetic changes required to derive the sequence of the gene in each organism from a common ancestor.
