Mediastinal sarcomas: experience using fine needle aspiration cytopathology

Table 1: Performance of different locoregional staging techniques adapted from Toloza 2003. Findings in fourteen fine-needle aspiration biopsy specimens and one pleural fluid specimen. When we encountered mediastinal tumors that were tightly adherent to the lung parenchyma, a wedge resection was sometimes needed and the resection site was closed using an endostapler Covidien ®, Mansfield, MA, USA or Ethicon Endo-Surgery ®, Inc.

Pulmonary function is compromised in children with mediastinal lymphoma

Finding cancer early usually makes it can be treated while it is still small-scale and is less likely to have spread to other parts of the body.

Notes: Includes bibliographical references and index.
This edition was published in 1995

Am J Pathol 2012; 181:1069—77.
Minimal access in cardiothoracic surgery.

Primary Seminoma in the Middle Mediastinum: Case Report in a 69

Epithelioid hemangioendothelioma: cytomorphology and histological features of a case. The actual resolution of PET scans is about 5 mm

Malignant schwannoma of the upper mediastinum originating from the vagus nerve

Mediastinal lymph node staging with FDG-PET scan in patients with potentially operable non-small cell lung cancer: A prospective analysis of 50 cases. The cytopathology of synovial sarcoma: a study of six cases, with emphasis on architecture and histopathologic correlation.

Mediastinal Tumors

The technique is often challenging, due to fibrosis and severe adhesions. Advocates of single-port VATS have emphasized its benefits, including better cosmesis, less pain and faster recovery in the early postoperative period.

Non

Sclerosing rhabdomyosarcoma in adults: report of four cases of a hyalinizing, matrix-rich variant of rhabdomyosarcoma that may be confused with osteosarcoma, chondrosarcoma, or angiosarcoma. . It is generally accepted that endoscopic techniques are suitable to prove suspicious mediastinal lymph nodes PET-positive finding , especially when the lymph node is not reachable by mediastinoscopy, but cannot be used to exclude mediastinal lymph-node disease because of the low negative predictive value.
