## Helping Skills: The Empirical Foundation by Clara E. Hill

In this model, dissemination partnerships provide an authoritative seal of approval for new knowledge and help identify influential groups and communities that can create a demand for application of the evidence in practice. Hill About the Editor Clara Hill, PhD, is a professor in the Department of Psychology at the University of Maryland, College Park. If implications of the EBP are fully assessed, anticipated, and planned for, the practice is more likely to be adopted.

## HELPING SKILLS: EMPIRICAL FOUNDATION

In planning investigations, researchers must use a conceptual model to guide the research and add to the empirical and theoretical understanding of this field of inquiry. This model provided the framework for a multisite study that tested the effectiveness of a multifaceted TRIP intervention designed to promote adoption of evidence-based acute pain management practices for hospitalized older adults. Implementing evidence-based safety practices are difficult and need strategies that address the complexity of systems of care, individual practitioners, senior leadership, and—ultimately—changing health care cultures to be evidence-based safety practice environments.

## Empirical

When the clinical questions of end users can be addressed through use of existing evidence that is packaged with end users in mind, steps of the EBP process take less time and more effort can be directed toward the implementation, evaluation, and sustainability components of the process.

## The Evidence for Evidence

The organizational governance supports use of these practices through various councils and committees such as the Practice Committee, Staff Education Committee, and interdisciplinary EBP work groups.
