## **Carbon Dioxide Emission Factors for Coal**

The possibility of removing significant amounts of mercury from coal in this process was confirmed in the following studies: Dziok et al. Surface mining can be used when a coal seam is close enough to Earth's surface to allow the overburden to

be removed easily and inexpensively. Only those brands of cigarettes included in the list may be sold in Alaska.

### Distribution and mode of occurrence of selenium in US coals

Because the dates of the samples range from 1900 through 1986, it was thought that changes in laboratory analysis techniques over the years might have influenced the resultant carbon-to-heat-content ratios. The Compact incorporates the standard three-factor apportionment formula of UDIRPA. In the case of mercury, the existing regulations define two issues: total mercury content and water-leachable mercury content.

### Physicochemical Properties of Certain Minor Elements as Controlling Factors in their Distribution in Coal

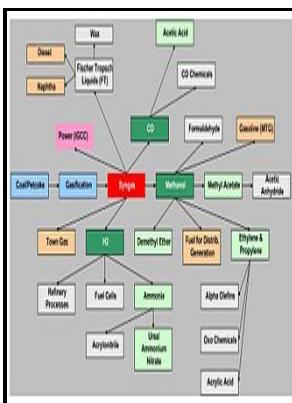

Significant amounts of mercury were also noticed for barite, siderite, and aluminosilicates. When the coal is combusted, it creates an dust. Therefore, this process may allow for efficient mercury removal from coking coal and, thus, it will allow for reducing mercury emission from coking plants as well as for lowering mercury contents in coal coking products.

### Report No. 15

It has to be mentioned that Hg-rich sulfides were found in the middling products derived from the process of coking coal washing. Methodology and Statistical Checks EIA's carbon dioxide emission factors were derived from data in the EIA Coal Analysis File, one of the most comprehensive data sources on U. Coal Preparation 1998, 19 3-4 , 297-317.

### Nature and distribution of phosphorus minerals in Cook Inlet coals, Alaska

Most frequently, mercury contents above the detection limit were obtained for sulfides and less often for carbonates and aluminosilicates. Effect of Sodium Removal on Chemical Looping Combustion of High-Sodium Coal with Hematite as an Oxygen Carrier. Pennsylvania anthracite, which is produced in small amounts, has the highest emission factor among all coal ranks 227.
