Preferred Practice Patterns for the Profession of Speech

Studies in Second Language Acquisition, 31, 533—557.

Metaphor and Second Language Learning: The State of the Field

Consultation is conducted according to the Fundamental Components and Guiding Principles.

Chapter 6. Variationist perspective(s) on interlocutor individual differences

Within specific communicative settings, this confluence of individual-level and group-level influences on bilingual speech production will presumably modulate and be modulated by the adaptive mechanisms that seek to balance talker-oriented and listener-oriented constraints i. The exaggerated form of speech, as originally found in infant-directed speech Kuhl et al. We have also noticed how learning types correlate to language learning and how then the patterns of strategy use differ from one individual to another.

English as a second language

Role of speech-language pathologists in the habilitation and rehabilitation of cognitively impaired individuals.

Gradient and categorical patterns of spoken

Littlemore 2003a listed four groups of strategies: substitution, substitution plus, reconceptualization and functional reduction, with reconceptualization being the most communicatively effective.

Language

Or, do individual talkers adopt global, idiosyncratic speech production strategies, or styles, that are evident in their speech regardless of the language being spoken? Results and — show that the degree of stress-timing is highest in English produced by native speakers, followed by Chinese advanced learners, and then beginners. Decontamination, cleaning, disinfection, and sterilization of multiple-use equipment before reuse are carried out according to facility-specific infection control policies and services and according to manufacturer's instructions. Equipment is updated and customized as appropriate.

A DYNAMIC LOOK AT L2 PHONOLOGICAL LEARNING: Seeking Processing Explanations for Implicational Phenomena on JSTOR

On average, the L2 intelligibility scores are lower than the L1 intelligibility scores even with the signal-to-noise ratio boost of 4—5 dB for the L2 speech. All recording sessions were conducted in a sound-attenuated booth using a Shure SM81 Condenser Handheld microphone. Clinical Indications Communication modification is prompted by referral or upon request, including self-referral.

Automatic selective perception (ASP) of first and second language speech: A working model

The fact that different speech sounds are cued by different spectral and temporal parameters further complicates the interpretation. LTASS slope was measured as the change drop in energy from the 0- to 1-kHz range to the 1- to 4-kHz range, a measure that is related to vocal effort. Similar to chosen images, the fixation analysis was twofold.
