6. Conclusions and Recommendations

Intramural and extramural research priorities should be focused on both short and long-term hazard prevention and on advancing understanding of foodborne pathogens and other food-related hazards; research results should then be integrated into the standard-setting and regulatory program. Further advice can be found from and.

Food Hygiene

It is important to recognize that limiting allocation of resources to only those areas where high priority hazards exist can create another problem: other hazards with somewhat lower priority but with a much greater probability of reduction or elimination will not be addressed due to limited resources. Food hazards can then be identified at each step and any necessary controls put in place. Please go to the page for additional, specific information about the regulation of animal feed.

Evaluation of street food vendors' hygienic practices using fast observation questionnaire

An effective and efficient food safety system must be based on science.

Guidance for larger food operations

In evaluating possible structures, the committee realized that past experience with other structures or reorganizations, including the creation of new agencies, such as the Environmental Protection Agency, should inform any final judgment.

Identification of risk factors to be considered for food establishments' risk assessment models

Specifically, the committee believes that the development and, critically, the use of a scientifically supportable foundation for regulation is not likely to be achieved within the current scattered organization of federal food safety programs, where responsibility is dispersed, budgets are separate, a unified mission is lacking, and no single official has formal or public overall responsibility and authority for performance. The effectiveness of efforts to ensure the safety of food for US consumers is not solely, perhaps not even primarily, the responsibility of the federal government. This certification may be used to facilitate the entry of imports.

Food Safety Modernization Act and Animal Food

COVID-19 Cleaning and Sanitation Cleaning and disinfection are as important for the control of viruses as for other forms of food contamination and the same basic principles must be followed.

Food Hygiene

Nor, in the committee's view, can this goal be achieved through a coordinating committee similar to that currently provided via the National Food Safety Initiative. Recommendation IIIa: To implement a science-based system, Congress should establish, by statute, a unified and central framework for managing federal food safety programs, one that is headed by a single official and which has the responsibility and control of resources for all federal food safety activities, including outbreak management, standard-setting, inspection, monitoring, surveillance, risk assessment, enforcement, research, and education. The work of the states and localities in support of the federal mission deserves better formal recognition and appropriate financial support.

Risk Assessment in Food Safety

A company's commitment towards food safety was identified as an important risk factor contributing to the magnitude of the risk attributed to a food establishment. You're looking at OpenBook, NAP. Recommendation IIb: Congress and the administration should require development of a comprehensive national food safety plan.
