Towards the rational use of high salinity tolerant plants

These results contribute to mission planning by providing information to balance the cost of additional sensor capabilities and the benefit to farm managers. In the case of observed worldwide woody plant encroachment into arid and semiarid grasslands, the current paradigm that more ecosystem carbon sequestration would occur was found to be incorrect for two grasslands being invaded by mesquite in southeast Arizona.

Experiments of Plant Growing under Irrigation with Saline Waters from 2000 MG/Litre T.D.S. (Total Diluted Solids) Up to Sea

These results suggest that for water-limited systems like semi-arid rangelands, understanding how future precipitation patterns change in concert with rising CO₂ and temperature and collectively impact soil water content may be critical in forecasting the impacts of global climate change on rangeland forage production.
