Evapotranspiration from a boreal forest drainage basin using an energy balance/eddy correlation technique

In general, the compressive strength, axial strain at failure and Poisson C, mainly under the unconfined condition. A 6-m meteorological tower was employed to measure the atmospheric variables of air temperature, relative humidity, and wind speed all at 2-m height , as well as soil moisture at three depths 2, 10, and 20 cm using Campbell Scientific, Inc.

Source parameters of seismic events at the Underground Research Laboratory in Manitoba, Canada: Scaling relations for events with moment magnitude smaller than -2

The results confirm the independence of the model with respect to its discretization and highlight the pertinence of the proposed discrete approach for the study of large scale boundary value problems. J Geol 12 1 :39—57.

The Energy Budget of Canadian Shield Subarctic Terrain and Its Impact on Hillslope Hydrological Processes in: Journal of Hydrometeorology Volume 3 Issue 2 (2002)

During a normal year, the storage deficit may prevent a runoff response from autumn rains. Bull Eng Geol Environ 73:689—706.

Fire Extinguisher Inspections and Recharging Winnipeg

Each individual instrument must be calibrated, modified and tested under simulated conditions. PAST AND CURRENT PROGRAMS AT THE URL Twenty-one-year leases from the Government of the Province of Manitoba for the surface and underground land use, granted in 1980 and later extended to 2011 allows drilling, excavation, and testing for research purposes but excludes the use of radioactive wastes. Successive temperature logs have been obtained over a period of two years in three closely-spaced boreholes in the Lac du Bonnet batholith of the Superior Province of the Canadian Shield.

MacSphere: Isotopic Studies of the Groundwaters and their Host Rocks and Minerals from the Underground Research Laboratory (URL), Pinawa, Manitoba, Canada

We developed and maintain good relationships with residents in the surrounding areas. North, and NNE to NE trends for in situ maximum compressive stresses measured above the 250-m depth, possibly contain a large component of remanent stress.

In situ stress compared to structures in Lac du Bonnet Batholith, Manitoba, Canada

A program will be prepared to suit new requirements. Net radiation was larger in May of 2000 than in May of 1999, but the situation was reversed in June. Geological challenges in radioactive waste isolation.

The Effects of Temperature And Pressure On the Mechanical Properties of Lac Du Bonnet Grey Granite

In situ stresses with SE to SSE trends are common near NE-striking thrust faults below the 250-m depth. Cite this chapter as: Drury M.

Tectonothermics of modern and ancient continental margins

Larger-scale tests were performed to help establish whether the solute transport properties within zones of intensely fractured rock are scale- or direction-dependent and to develop methods for extrapolating the test results to larger scales by combining tracer tests with crosshole hydraulic response tests.
