## Devonian

West of the Rocky Mountain Trench, subsurface data are minimal but surface stratigraphic data suggest that there may have been a number of margin-parallel sub-basins along the western edge of the North American Craton see for example Struick, 1987. Family ATRYPIDAE Gill. The discussion on dolomitization models for the three types of dolomite described in this study is based on previous work and results from local and regional studies summarized in Tables , and.

## Geochemical constraints on the origin of the Kicking Horse and Monarch Mississippi Valley

Varying thermal conductivity for individual intervals, even thick formations such as the Fort Simpson Formations, has a relatively negligible effect.

## Chapter 3

This means that 82% of the wells drilled in the state were dry holes. Map showing geography of east-central Idaho, with some of the localities mentioned in this article. The presence of thin calcite twinning could indicate that the calcite infillings were affected by tectonic deformation, under a temperature below 140 °C Burkhard ; Ferrill et al.
