Lone versus multiple offending in homicide: Differences in situational context

Interviews are conducted at six-month intervals with all persons 12 years of age or older living in a household. Among juveniles this is less problematic, but it is an issue that has not yet been adequately resolved.

Lone versus multiple offending in homicide: Differences in situational context

This distribution pattern was stable over the 10-year interval between the observations and was invariant to alcohol intoxication, consequences, and reasons for the assault. INDIVIDUAL-LEVEL RISK FACTORS IN VIOLENT OFFENDING Having reviewed the individual-level factors underlying the risk of violent victimization, we now turn our attention to the issue of violent offending.

Gender and Homicide

By situational-level risk factors, we are referring to those factors, broadly defined, that influence the initiation or outcome of a violent event.

REFERENCES

One way to examine these contextual issues is through racial disaggregation of both the crime rate and the explanatory variables of theoretical interest e. Schmid 1960 correlated offense-specific crime variables, including robbery, with numerous social structural variables for census tracts in Seattle. Compared to filicide, few parricides in Australia involved the death of the offender nine per cent , with no female parricide offenders committing suicide following the murder.

Reconstructing homicide events: The role of witnesses in fatal encounters

COMMUNITY-LEVEL SOURCES OF VIOLENCE The purpose of this section is to review empirical research on the community-level correlates of criminal violence. Type of homicide and variation in regional rates.
