A survey of audio-based music classification and annotation. One of the most important contributions of Hulme's concept is that it kept the focus on the literature to be indexed, classified, represented in libraries and today information systems more generally. That is, with 69 songs at a time, we first optimized the choice of the p-value threshold for SIS through leave-one-out cross-validation with a 68-versus-1 split to compute the out-of-sample negative log-likelihood , then with the variables selected based on the optimized p-value threshold we fit a logistic regression via elastic net regularization on the 69 songs using 5-fold cross-validation to estimate the tuning parameters.
